

COBOT KPI's

This document provides a **clear, structured, and human-readable** explanation of the calculation logic, KPIs, and functional features implemented in the **RPA Dashboard Application**.

It is intended for:

- Business stakeholders
- Department SPOCs
- RPA program managers
- Technical teams
- Leadership reviewers

The goal is to ensure **complete transparency** in how savings are calculated and how data is displayed.

1. Key Performance Indicators (KPIs) & Calculation Logic

The RPA Dashboard aggregates real-time automation data from multiple structured sources to ensure accurate and consistent reporting.

Data Sources

The system collects and processes data from:

- Bot Execution Logs
- Master Bot Configuration Files
- Onboarding Records
- Schedule Configuration Data

All calculations are automated and refreshed during every system synchronization cycle ("Sync").

This ensures that all metrics displayed across the dashboard reflect the most recent execution state and configuration logic.

1.1 Organization-Level Metrics (Landing Page)

These KPIs provide a high-level, executive summary view of the automation program across the organization.

Total FTE Hours Saved

Definition

The cumulative automation hours saved by all bots since their respective onboarding dates.

Calculation Logic

- Calculated individually for each bot
- Aggregated across departments
- Includes both:
 - Run-Based Savings
 - Time-Based Projected Savings

Purpose

Measures total productivity benefit generated by automation.

Annualized FTE

Formula

Annualized FTE = Total FTE Hours Saved ÷ 8 ÷ 242

Where:

- 8 = Standard working hours per day
- 242 = Approximate working days per year (i.e.: 365 days – 52 Sundays – 26 Saturdays – 10 Mandatory leaves – 21 paid leaves – 7 Casual leaves – 7 Sick Leaves)

Meaning

Represents the number of full-time employees effectively saved annually due to automation.

Example

If Total FTE Hours Saved = 19,360:

$$19,360 \div 8 \div 242 = 10 \text{ FTE}$$

This indicates automation is equivalent to saving 10 full-time employees per year.

FTE Hours Saved (Current Month)

Definition

Total hours saved within the current calendar month.

Scope

- Includes only savings generated in the active month
 - Resets month-over-month
 - Used for monthly reporting and leadership reviews
-

Unique Jobs Runned

Definition

Total count of successful automation job executions on the most recent sync date.

Purpose

Indicates execution volume and automation activity level.

Unique Co-Bots

Definition

Count of distinct bots that successfully executed at least once on the latest sync date.

Purpose

Measures automation adoption and operational coverage across departments.

1.2 Hybrid Savings Model (Core Calculation Logic)

The system intelligently applies different savings calculation logic based on each bot's scheduling configuration.

This ensures:

- Historical accuracy
- Fair valuation
- Consistent projection logic

A) On-Demand / Multiple Schedule Bots

(Run-Based Model)

Used For:

- Manually triggered bots
- Bots running multiple times per day
- Bots without fixed schedules
- Event-triggered automation

Logic

Savings are credited only after successful execution.

Formula

Total Savings = Completed Runs × Value (FTE) Per Run

Example

Value Per Run = 2 hours
Completed Runs = 50

Total Savings = $50 \times 2 = 100$ hours

This ensures that only actual execution generates measurable savings.

B) Scheduled Bots (Daily / Weekly / Monthly)

(Time-Based Projection Model)

Used For:

- Daily scheduled bots
- Weekly scheduled bots
- Monthly scheduled bots
- Bots with fixed frequency

Logic

Savings accumulate daily from onboarding date to maintain historical consistency.

Formula

$\text{Total Savings} = \text{Days Since Onboard} \times (\text{Monthly Hours Saved} \div 30)$

Why divide by 30?

To normalize monthly savings into daily accrual.

Example

Monthly Savings = 60 hours

Days Since Onboard = 90

Daily Accrual = $60 \div 30 = 2$ hours per day

Total Savings = $90 \times 2 = 180$ hours

This ensures smooth and predictable savings growth over time.

1.3 Status Classification & Normalization

To eliminate inconsistencies in naming conventions, the system standardizes all input statuses into three visual categories.

Live (Green)

Mapped From:

- Deployed
- Live
- Active
- Production
- Running

Meaning

Bot is operational and actively delivering automation value.

Inactive (Amber)

Mapped From:

- Inactive
- In Active
- Hold
- Suspended
- Stop
- Pending
- Development

Meaning

Bot exists but is not currently generating savings.

Failed (Pink)

Mapped From:

- Failed
- Execution errors
- Runtime failure

Meaning

Bot attempted execution but failed.

2. User Features & Functional Modules

2.1 Landing Page

The landing page serves as the executive overview dashboard.

Sync Now

- Manually triggers data refresh
 - Pulls latest execution logs
 - Recalculates all KPIs
 - Updates analytics and charts
-

Overall Stat Banner

Displays:

- Total FTE Hours Saved
- Annualized FTE
- Monthly Savings
- Active Bots

Designed for quick leadership visibility.

Interactive Org Chart

Hierarchical Structure:

Adani Renewables → Department → SPOC → Bot

Used to:

- Understand reporting structure

- Identify high-performing units
 - Drill into department-level performance
-

Department Cards

Each department card displays:

- Active Bots Count
- Total Hours Saved
- Health Indicator

Cards are clickable for detailed analysis.

2.2 Department Dashboard

Provides granular department-level insights.

Hours Saved Variation (Monthly Trend)

Area chart tracking:

- Cumulative hours saved
- Daily accrual trend

Purpose:

Visualizes automation growth momentum.

Man Hours Saved Variation

Derived Metric:

$\text{Man Hours Saved} = \text{Total Hours} \div 8$

Shows human-equivalent productivity gain.

RPA Table Layout

Each bot entry includes:

- RPA Agent Name
- Description (Modal View)
- PDD Link
- Business SPOC
- Configured Monthly Hours
- Latest Run Status

Designed for operational monitoring and review.

2.3 COBOT Organization Chart (Interactive Tree)

Structure

Adani Renewables

→ Department

→ SPOC

→ Bot

Navigation Features

- Expand / Collapse All
 - Zoom
 - Pan
 - Click-to-Drill
-

Smart Tooltips

Displays:

- FTE Hours saved on [Date]
- FTE saved in [Month-YY]
- Total FTE as on [Date]

Provides contextual awareness at every hierarchy level.

2.4 Bot Details Analytics (Modal View)

When a bot is selected, a detailed analytics window opens.

Value Per Run

Displays:

- Time saved per execution
 - Shown in hours or minutes
-

Lifetime Runs

Displays:

- Total execution count
 - Success rate (%)
-

Savings Growth Projection

Trend chart projecting expected savings over the next 6 months based on historical performance.

Run Performance (Last 30 Executions)

Bar chart showing:

- Success
- Failure

Helps identify execution instability patterns.

3. Data Ingestion & Matching Logic

The dashboard ensures data integrity using structured identification logic.

3.1 Waterfall Matching Algorithm

When execution reports are uploaded, bot identification follows:

Exact Match

Direct match with Use Case Name.

Prefix Match

Matches strings before delimiters such as `_` or `|`.

Example:

```
AUC147_Bot  
AUC147|Prod
```

Both match:

AUC147

Fuzzy Check

Keyword containment comparison if no exact match is found.

This reduces data loss due to naming variations.

3.2 Automated Normalization Engine

Time Parsing

Converts:

- 5 min
- 1 hr
- 90 sec

Into decimal hours.

Example:

90 sec = 0.025 hours

Date Standardization

Auto-detects and converts:

- DD-MM-YYYY
- YYYY-MM-DD
- MM/DD/YYYY

Into a unified internal format.

Department Tag Standardization

Example:

BT → Business Transformation

Fin → Finance

Prevents duplicate reporting and inconsistency.

Conclusion

The RPA Dashboard is designed to provide:

- Transparent savings calculation
- Accurate FTE equivalency
- Real-time performance visibility
- Structured hierarchy analysis
- Intelligent data normalization

The hybrid savings model ensures that both run-based and scheduled bots are fairly evaluated while maintaining historical consistency and reporting integrity.
